

Ijlal Furqaan

Full-Stack Developer & AI Engineer

+49 152 15155020 ijlalfurqaan5@gmail.com linkedin.com/in/ijlal-furqaan-32b7251b6 github.com/IjlalFurqaan Portfolio

Profile

Full-stack developer and AI engineer with production experience in agentic AI systems, autonomous deployment pipelines, and real-time market data platforms across GCP and AWS. Pursuing an M.S. in Computer Science in Germany; certified in Google Cloud and Generative AI with LLMs.

Education

M.S. Computer Science <i>Philipps-Universität Marburg</i>	2024 – 2026 Marburg, Germany
B.E. Computer Science <i>Osmania University</i>	2017 – 2021 Hyderabad, India

Professional Experience

Working Student Software Developer <i>Deutsche Börse</i>	09/2025 – Present Eschborn/Frankfurt, Germany
- Designed and deployed an end-to-end autonomous AI deployment pipeline handling full ticket-to-code generation, automated infrastructure provisioning via Terraform, cloud logging, and GCP execution – enabling direct delivery from ticket to live environment with observable rollback points. - Engineered a suite of specialized AI agents covering codebase scanning, automated code generation, security vulnerability detection, and end-to-end test execution – each configured with distinct tool-calling patterns and prompt strategies to operate autonomously within the CI/CD pipeline. - Applied Generative AI and agentic AI workflows integrating advanced RAG and MCP server architectures for automated instrument classification and anomaly flagging using Vertex AI and LLMs. - Built the T7 Reference Data service exposing instrument metadata via the DBG GraphQL API using Python, JavaScript (Node.js, Express), and GraphQL. - Built live Market Supervision dashboards with React, TypeScript, and Zustand; used AG-Grid virtualization for high-volume datasets. - Provisioned GCP infrastructure with Terraform; managed Linux server deployments, Bash shell scripting, and automated CI/CD pipelines via SSH. - Reduced middleware network calls by 30–40% via API batching, caching, and WebSocket-based real-time updates.	
Software Engineer <i>Mphasis</i>	09/2021 – 01/2024 Pune, India
- Built and modernized full-stack applications using Java (Spring Boot), React, and Angular, improving user engagement and retention by 30%. - Developed highly responsive performance dashboards utilizing custom React hooks and Angular components for dynamic, high-throughput rendering. - Designed and maintained secure API integration patterns to seamlessly sync application data across legacy customer environments and modern cloud databases. - Automated repetitive data processing tasks using Python and shell scripts, reducing manual effort by over 15 hours weekly. - Maintained 95%+ test coverage across critical applications using pytest, significantly reducing production bugs. - Shipped features on schedule through Agile collaboration; managed version control and peer code reviews via Git and GitHub.	

Projects

LLM-Powered Document Q&A	Python, LangChain, Vertex AI, RAG
Built an end-to-end RAG pipeline utilizing Vertex AI, LangChain, and semantic search to answer natural language queries over enterprise documents.	
Bat Tracking System	Python, YOLO, OpenCV, Flask
Engineered a real-time bat flight detection and tracking application using YOLO, OpenCV, and a Flask-based backend for high-throughput streaming.	

Technical Skills

Languages: Python, JavaScript/TypeScript, Java, C++, SQL
Frameworks: React, Angular, Node.js, Express.js, Spring Boot, GraphQL, Flask, Redux, Zustand, AG-Grid, LangChain, TensorFlow, PyTorch
AI & ML: Agentic AI, LLMs, Generative AI, RAG, MCP, Prompt Engineering, Vertex AI, Google Cloud AI Platform
Cloud & DevOps: GCP, AWS, Terraform, Docker, CI/CD, GitHub Actions, Linux
Databases: MongoDB, PostgreSQL, MySQL
Tools: Git, GitHub Copilot, VS Code, IntelliJ IDEA, Jupyter
